- d) To cover aviation needs for jet fuel and high-test gasoline.
- a) To supply fuel oil for the oil-fired installations of various industrial enterprises (steel mills and refined-steel mills, machine-construction plants, and chemical plants).

In addition, there is the task of providing necessary supplies to various branches of industry which require special gasoline and test gasoline and also solvents (e.g., the food, paint and varnish, and household chemicals industries). Furthermore, large quantities of high-quality gasoline and diesel fuels must be made available for export. The following table gives information on the consumption by the most important consumers in 1958 (amounts in thousands of tons):

Co	nsumption	Gasoline	Diesel Oil
	Motor transport, including unrestricted sales	410.8	276.3
	Agriculture	43.2	328.7
	Shipping (fishing, high seas, and inland)	0.9	64.5
	Export (including re-export, the export of fuel amounted to 49,800 tons.) In addition, the oil-fired installations of vari required 207,500 tons of heating oil; 73,000 ton	nun industrial an	280.3  terprises line, test gasolines,
	and solvents were put at their disposal.		

From these data can be seen the importance of the Fuels Production Group for carrying out the main economic task, and this also indicates the necessity for a rapid development to keep up with increasing requirements.

# 1.2 Comparison with Per Capita Consumption in the Federal Republic

The necessity for rapid development will become even more evident if DDR consumption and production of liquid fuels and fuel oils in 1958 is compared with that of the West Zone of Germany:

(Amounts in thousands of tons. Per capita consumption or production in kg.)

ı.

	All fuel	<u>s</u>	Casoline	88	Diesel C	)11	Fuel Oil	
	Amount	Per c.	Amount	Per c.	Amount	Per c.	Amount	Per c. cons.

x) from Brennstoffchemie 4/59.

Population, according to the <u>Statistisches Jahrbuch 1958</u> (date of information: 31 December 1957), is: DDR - 17.4 million; West Zone - 53.1 million.

### 1.3 Growth of Requirements

The increasing requirements of consumers for liquid fuels in the Seven-Year Plan underlie the political-economic goal of the Production Group's long-range planning and modernization planning. The increasing requirements are shown in Table 1 on page 4. The increasing requirements of some groups of consumers and also the fuel requirements of agriculture and the motor transport industry are shown in Table 2 on page 5. The following tabulation of the most important consumers indicates the growth of fuel oil requirements —in thousands of tons/:

Various indus-	8 1959	1960	1 <u>961</u>	1962	1963	1964	1965	% of 1958
trial concerns 74	83	102	232	293	719	891	.358	1859.0
Transport (incl. 4. ships and railroads)		15	30	60	60	60	70	1590.0
Petroleum-crack- ing units & gas turbines	<b>2.</b> 5	9 ,	47	130	158	551	339	-

In the growth of requirements, the following is particularly to be noted:

- 1. Rapid increase in the unrestricted sale of gasoline, that is, a very rapid development of private motor transport. Satisfying this requirement is a definite prerequisite for raising the standard of living.
- 2. Both the motor transport industry and agriculture are changing from gasoline to diesel oil. These consumer groups' demands on diesel oil production are increasing to a substantial degree.
- 3. The expansion of the merchant fleet, the fishing fleet, and inland shipping and the partial conversion of the Reichsbahn (East German railroad) to diesel locomotives make great demands on diesel-oil production.
- 4. The greatly increasing requirement for fuel oils results from the construction of six petroleum-cracking installations, to replace obsolete anthracite-fueled gas works, and from the conversion of numerous heating plants to a fuel-oil basis, particularly in the steel and iron industry and in the chemical industry. Beginning in 1965, heating installations burning fuel oil are planned for dwellings.

The growth of liquid-fuel requirements in the DDR in comparison to the estimated development in the Federal Republic (from Erdől und Kohle, Vol. 5/1959) is presented in Table 3 on page 6. The population figures of 31 December 1957 are used as the basis for per capita consumption.

Although the per capita consumption of fuels in the DDR does not reach that of the Federal Republic, according to the West German data used as a basis (for the tabulation), the rate of increase in the DDR is considerably higher. The special significance of the development of the Fuels Production Group is underlined by the following: its share in gross production (at Plan prices) of the whole VVB Mineralble und Organische Grundstoffe is to increase from 45.8 percent in 1958 to 57.9 percent in 1965.

The Fuels Production Group's current long-range planning and modernization planning are to be the guideline for trade activities in order to cover requirements as far as possible and to achieve high profitability. This planning entails the great political-economic task of rapid development in accordance with the lines laid down by the 5th Party Congress of the SED for the rapid expansion of Socialism in the DDR.

# 2. Survey of the Present Status of the Production Branch

### 2.1. Plants of the VVB

The entire production of the petroleum industry is in the hands of the VVB Mineralble und organische Grundstoffe.

The Plants producing liquid fuels and fuel oil are:

VEB Leuna-Werke "Walter Ulbricht"

VEB Kombinat "Otto Grotewohl" Böhlen

VEB Hydrierwerk (Hydrogenation Plant) Zeitz

VEB Synthesewerk (Synthesis Plant) Schwarzheide

VEB Kombinat Espenhain

VEB Teerverarbeitungswerk (Tar-Processing Plant) Rositz

VEB Kombinat Gölzau

VER Paraffinwerk "Vorwarts"

VEB Mineralblwerk Lützenkendorf

VEB Mineralolwerk Herrenleite

WEB Mineral blwerk Klaffenbach

VEB Erd5lverarbeitungswerk (Crude-Oil Processing Plant) Schwedt

Five of the plants of the VVB lie in <u>Bezirk</u> Halle, three in <u>Bezirk</u> Leipzig, one in <u>Bezirk</u> Dresden, one in <u>Bezirk</u> Karl-Marx-Stadt, and one in Cottbus; the new plant at Schwedt is in <u>Bezirk</u> Frankfurt/Oder. The <u>Bezirke</u> of Halle and Leipzig are the most important. The largest plants are Leuna, Böhlen, and Zeitz.

#### 2.2 Varieties of Fuels

The following products are considered as fuels:

Automotive gasoline This is produced in the Leuna, Böhlen, Zeitz,

and Schwarzheide plants, and beginning in 1963 it will be produced also in Schwedt. The

octane numbers are between 58 and 87.

Aviation gasoline B 95 is produced by the Böhlen plant.

Special and test gasolines

These are produced the Böhlen, Schwarzheide, Vorwarts, and Klaffenbach plants.

Jet fuel D is supplied by Böhlen and Schwarzheide,

and beginning in 1963 it will be furnished also

by Schwedt.

Diesel oil All the above plants, except "Vorwarts" and

Klaffenbach, are engaged in diesel-oil production.

Fuel oil All plants, except Zeitz and Klaffenbach, produce fuel oil.

#### 2.3 Raw Materials

The following are the raw materials for the production of liquid fuels:

- a) Brown coal low-temperature and gas-works tars. (Generatorteere).

  Brown coal medium and light oils.
- b) Crude oil.

S-E-C-R-E-T

8\_

50X1-HUM

In accordance with their location and history, the plants, with the exception of Lütskendorf, Herrenleite, and Klaffenbach, are being fitted for processing brown-coal products. The brown coal serves both as rew material and as a source of energy; this assures the shortest transport route and encouragescan integrated industrial process. The high-pressure hydrogenation of coal and tar according to the Bergius-Pier process originated largely in the effort to find a suitable means of processing East -German brown coal. The Lützkendorf plant, right from its establishment in 1939, processed small quantities of crude oil.

After 1945, crude oil in increasing quantities appeared in addition to brown coal as a raw material, and during the course of the next few years its role will appreciably increase. This is shown in the following tabulation of product utilization in percentages as related to 1958:

	1958	1959	1960	1961	1962	1963	1964	1965
Tar	100	100.2	100.6	101.2	101.3	100.7	106.4	106.8
Crude oil	100	135.7	159.7	195.7	248.4	344.5	<b>39</b> 9.5	5 <b>32.</b> 6

Even to server is the relationship of tar and light oil to crude oil in the different years:

		1958	1959	1960	1961	1962	1963	1964	1965
Tar pro-	B	62.2	54.4	50.6°	45.7	40.0	32.6	30.2	24.8
Crude oil	-3	37.8	45.6	46 J	54.3	60.0	67.4	69.8	75.2

From the above, it is evident that use of crude oil will increase five-fold as the percentage of crude oil in relation to the whole raw-material utilization increases from 37.8 to 75.2 percent.

Crude oil for processing is obtained from various places:

- a) From Matzen, particularly suited to the production of lubricating oil (Lützkendorf).
- b) From Tuymazy, used for various purposes including the production of bitumen (Espenhain, Schwarzheide, Gölzau).
- c) From Sokolovogorsk (Herrenleite).
- d) From Mukhanovo (Luna, Schwarzheide.)
- e) From Krasnodar (Leuna).

In the future:

- f) From Albania, for bitumen production (GBlzau).
- g) From Romashkino (Schwedt).

#### 2.4. Technology

In the processing technology, four methods stand out:

- a) Hydrogenation.
- b) Synthesis.
- c) Distillation of tar or crude oil.
- d) Cracking of tar or crude oil.
- On a) Leuna, Böhlen, and Zeitz work by high-pressure hydrogenation, the lastnamed according to the TTH (Tieftemperatur Hydrigang - low temperature hydrogenation) method. In these plants, there are also medium-pressure

S-E-C-R-E-T

-G-

50X1-HUM

re-forming installations which work with platinum catalysts, i.e., the HTM \* process. Leuna has six slurry-process chambers, four pre-hydrogenation chambers, two gasoline chambers, and one re-forming chamber, a total of 13 chambers. Of these, one gasoline chamber will be replaced by a slurry-process chamber. In Böhlen, there are three slurry-process chambers and four pre-hydrogenation chambers, one re-forming chamber and one refining chamber (tower); of these, the last will be replaced by a re-forming chamber in 1960. Böhlen also has an alkylation installation. In Zeitz, there are seven TTH chambers, which are all to be equipped with Catalyst 8376; in addition, there are one HTM chamber and one chamber for TTH residue cracking. Thus Böhlen and Zeitz process more than half of the available tars, while Leuna has the greatest capacity for processing crude oil, although Leuna will be surpassed by Schwedt.

			1958	1959	1960	1961	1962	1963	1964	1965
Tar	Böhlen	3	24.9	25.3	23.9	24.0	26.7	26.1	15.4	15.0
	Zeitz	3	31.9	32.7	33.2	34.5	34.4	35.4	40.8	41.4
Crude	e Leuna	%	49.8	50.4	47.2	40.8	35•7	23.2	20.2	15.0
	Schwedt	3	_	-	•	_		33.7	43.1	56.8

The three hydrogenation plants in 1958 produced 77 percent, and in 1959 produced 79 percent, of the total fuels of the VVB. The diesel oil produced by them is 75 percent of the total yield.

- On b) The synthesis plant at Schwarzheide works by the Fischer-Tropsch synthesis process, having 209 synthesis ovens and using a cobalt-thorium catalyst. Schwarzheide also has distillation installations for processing synthesis products.
- On c) The Rositz, Gblzau, Vorwärts, Lützkendorf, Espenhain, and Herrenleite plants work by pure distillation methods.
- On d) Schwarzheide and Rositz have installations for cracking tar or crude oil.

The part played by the individual processing techniques is given in percentages as follows:

	1958	1959	1965
Hydrogenation	59•7	58.9	31.3
Synthesis	4.5	4.2	2.1
Crude-oil dist	illation 11.6	15.0	55.1
Tar distillation	on 20.1	18.1	6 <b>.</b> 6
Crude-oil crack	king 4.1	3.8	2.6
Tar cracking			2.3

The fuel production plants in the DDR are considerably smaller than those in West Germany. Thus the hydrogenation plants produce more than 1,500,000 tons per year and the distillation plants more than 3,000,000 tons per year, which is the capacity intended for Schwedt. As far as technology is concerned, we do not have catalyst cracking at all, and thermal cracking is done only in Rositz and Schwarzheide. Our distillation plants in general are small and old. We have no modern, fully automated plants. We still have no Kokeranlage (coking-process plant); the first chamber will go into operation in 1962. In the DDR, fuel is produced chiefly by the high-pressure hydrogenation technique.

Comment: Possibly Boch-Temperatur-Methods-high-temperature process 50X1-HUM

S-E-C-R-E-T

50X1-HUM

The part played by medium-pressure technique is still small. West Germany does not have alkylation installations such as have existed in Böhlen since 1946. The octane numbers of the gasolines offered in West Germany are considerably higher than those in the DDR. We do not yet have this requirement for high-octane gasolines, because our engines do not have such high compression ratios as those in Western countries.

#### 2.5 Age of the Installations

The hydrogenation installations in Leuna mostly date back to the years 1926-1927. For the most part, they have remained unchanged. A change from coal chambers to crude-oil chambers or from gasoline chambers to re-forming chambers (1959 and 1962) was carried out at that time 1959 with the high-pressure equipment dating from earlier periods. Hydrogenation in Böhlen was started in 1935-1936 and in Zeitz in 1937-1939. The re-forming plant at Böhlen was put into operation in 1945-1946, and so was the alkylation plant. An HTM chamber was put into operation at Zeitz and the present apparatus built since 1955. The synthesis plant in Schwarzheide dates back to the year 1937, and so does the Carburol (carbonization method?) plant which has been used since 1955 for crude-oil cracking, whereas it was intended earlier for cracking crude paraffin. The Koppers Plant VII was boilt in 1943. The distillation installations of the other plants are newer or older, some being 30 years older. The cracking installation in Rositz, which has been under construction since 1953, will be ready for operation in 1960.

#### 2.6 Production

Production in 195° and the Plan for 1959 are as follows:

		1958	1959
Fuels,	total	2027.9	2324.4
Gasolin	nes	959.7	1081.9
incl.	Automotive gasoline	733.3	836.2
	Aviation rasoline	15.4	19.3
	Special & test gasolines	73.2	76.4
Diesel	oil	1068.2	1242.5
Jet fu	el	138.1	150.0
Fuel o	<b>i1</b>	294.1	317.3
The pe	rcentages are:		
Automo	tive gasoline	36.2	<b>36.0</b>
Diesel	oil	52.7	53-5
Fuel D	(jet fuel)	6.8	6.5

The hydrogenation plants of Leuna, Böhlen, and Zeitz have the greatest share in the production of automotive gasoline and diesel oil; in 1959 they are producing 79 percent of all fuels, 77 percent of all diesel oil, and 95 percent of all automotive gasoline. It should be noted that the hydrogenation plants were built chiefly for the production of paraffin or lubricating oils.

#### 2.7. Quality

In 1959, 39 percent of all gasoline was still delivered with octane numbers less than 72, and did not correspond to the TGL (Technische Morsen, Gütevorschriften und Lieferbedingungen = State Standards). This (low) quality will end in 1960.

S-E-C-R- E-T

50X1-HUM

# The other gasolines show the following qualities:

36.7	percent	-	72	octan
0.6	**	-	78	**
0.2		•	80	***
22.0		-	87	п
0.1		-	<b>8</b> 9	п
1.1		-	91	**

In the next few years, there will be an improvement in quality, so that by 1965 gasolines will produced only with octane numbers of 78,85, 87, and 95. The Leuna plant, because of its hydrogenation and re-forming installations, may very well produce quality gasoline with tetraethyl lead and with a sulphur content less than 0.01 percent. Bohlen, by means of hydrogenation, reforming, alkylation, and the addition of tetraethyl lead, can produce gasolines of any desired octane number and with a sulphur content below 0.01 percent. The gasolines produced at Schwarzheide are not very good as automotive gasoline and will not be marketed much longer. Fuel D (jet fuel) is produced by Böhlen and Schwarzheide in the quality according to T 1 (sic). The diesel oils are variable as to quality. Leuna produces diesel oil with a very low pour-point and with a low sulphur content. The Böhlen diesel oil has a pour-point between -15 and -20 degrees centigrade and has a correspondingly low sulphur content. Since 1955 Böhlen has refined raw diesel oil obtained from Rositz, and through this processing a higher quality can be produced than through the earlier chemical refining. The fuel cils produced in the DDR all have the character of heavy fuel oils and have a diverse sulphur content.

#### 2.8. Wear Coefficient

(Bruttowert)

The wear scefficient, expressed in 100 percent depreciation of gross value/
gives comparable figures only for three hydrogenation plants. In 1959, it
is 60 to 60 percent and rises or about 80 percent by 1965. For the other plants,
these figures vary greatly and depend on the different techniques employed in
the plants and the different care materials used.

#### 2.91 Labor Force

The status of the labor force and its development through 1965, as the fuelproducing enterprises' share in the total labor force of the VVBs, is shown to the following tabulation:

in the lottowing	1959	1960	1961	1962	1963	1964	1965
Total employees		8.3					
Production workers	7 33 0	10.8					

### 2.92 Labor Productivity

Labor productivity of the individual plants is not at all uniform, varying according to the processing techniques used, the raw materials processed, and the articles produced. A comparison of the plants is impossible without going into too great detail. The development of labor productivity, therefore, has been calculated only for the rate of production and for the value of the products in thousands of IM. For the Fuels Group, labor productivity will increase 279 percent by 1965.

# 3 People's Economic Plan - Tasks through 1965

## 3.1 Principal Task

In the field of fuel production, there are four important tasks:

- a) To increase raw material throughput from 3,000,000 tons in 1958 to 6,000,000 tons in 1965, involving particularly the transition from tar to mineral oil. (Erdoel).
- b) To make a definite improvement of quality, particularly that of gasolines.
- o) To change products in favor of diesel oil and fuel oil, that is, to foster the use of heavier fuels.

S-E-C-R-E-T

-12-

50X1-HUM

d) To improve production efficiency through changing from high-pressure to medium-pressure technique, increasing labor productivity to double, and reducing manufacturing costs by increasing the output.

The following trend of development appears from the above:

Capacity will be increased through the construction of the crude-oil plant at Schwedt and the modernization of the hydrogenation plant at the Leuna Works. This will make it possible to stop production at the smaller plants. Improvement of quality should be achieved through extensive introduction of the re-forming processes.

#### 3.2. Raw Materials Used

By 1965, the processing of tars, light and medium oils will remain virtually constant, except for the Schwarze Pumpe Combine. Thus tar processing will increase only 102.4 percent. The tars from Schwarze Pumpe are to be used for fuel oil until a suitable processing technique has been found. The processing of crude oil is to increase from 1,420,000 tons in 1959 to 6,000,000 tons in 1965, an increase of 522.5 percent, and thus will be the basis for the increase of fuel production.

The figures for raw material processing are as follows (in 1,000 tons):

	1960	1961	1962	1963	1964	1965
Tar	1449	1455	1453	1451	1451	1455
Light oil	<b>38</b> 8	397	<b>3</b> 99	409	416	436
Medium oil	38	38	<b>3</b> 8	38	<b>3</b> 8	<b>3</b> 8
Crude oil	1800	2200	2800	3980	4500	6000

The most treent of these tasks is the construction of the crude-oil processing plant at Schwedt, so that production can be started in 1963 and 3,400,000 tons can be processed in 1965.

In Tables 4 - 6, on pages 15 17, supply and demand for raw materials are contrasted.

The development of raw products utilization and the breakdown by plants are shown in Tables 7 and 8, pages 18 and 19.

#### 3.3 Production

٠.

The figures for fuels and fuel oil age as follows (in 1,000 tons):

	1960	1961	1962	1963	1964	1965	% of 1958
Aviation gasoline	22.5	22	22	55	2 <b>2</b>	22	
Fuel (automotive gasoline)	2250	5650	2865	31 <b>8</b> 0	34 <b>0</b> 0	4050	199.0
Special and test gasolines	80	85	90	<b>9</b> 5	100	105	
Jet fuel (Kraftstoff D)	172	190	200	<b>20</b> 6	515	218	
Fuel oil	500	<b>8</b> 50	1110	1150	1450	5000	757.5
Benzol incl. ethylbenzol	14.5	14.5	22.0	46.9	53.4	67.0	
o-Xylol	-		2.4	10.0	11.0	21.0	·
Increase in fuels	Я	16.4	9.4	10.3	7.5	19.1	
Increase in fuel (	oils 9	70.0	30.6	3.6	26.1	37•9	

Inasmuch as there is a gap between the crude-oil processing capacity of 1959 and the beginning of production in Schwedt, the installations currently processing crude oil must continue to operate, and emergency capacity must be created in some existing plants by means of modernization. The crude-oil distillation facility at Herrenleite was retired from operation in 1959 by the Technical Supervision Board, but a way has been found to put it back into operation, and 30,000 tons of crude oil per year can be processed in it.

The cracking installation at Rositz is to be completed in 1960. In Böhlen, an attempt is to be made in 1960 to refine crude oil by the Varga medium-pressure method in the two DHD (Dehydrierung unter Druck adehydration under pressure) chambers. Subsequently the installation is to be changed to a re-forming chamber.

In Leuna, a prehydrogenation chamber is to be replaced by a slurry-process chamber, and a gasoline chamber is to be converted to an extension of the re-forming chamber, with an output of 300,000 tons per year.

Beginning in 1962, production of benzol is to be undertaken, in 1963 production of o-Xylol, and in 1964 ethylbenzol. Since there will be a shortage of aromatics until Schwedt is an operation, and even afterwards, the following measures are to be adopted:

- 1. In Zeitz, the installation (replacing the HTM chamber) is to be put into operation in 1962, and benzol for Cumol (cumene) synthesis is to be produced from a light-oil fraction from Leuna and Böhlen. Furthermore, benzol is to be obtained from coke condensates.
- In Böhlen, an installation is to be built in which o-Xylol can be produced from re-forming gasoline.
- In Schwedt, beginning in 1964, all obtainable quantities of benzol, xylol, and ethylbenzol will be produced.

## . Modernization Program of the Fuels Production Group

The main support of increased fuel production is the new crude-oil refining plant at Schwedt, which will refine 2,000,000 tons of crude oil per year in 1963 and 4,000,000 tons by 1965.

Up to the year 1963, therefore, the chief burden of increasing the per capita production of fuels falls on the existing enterprises of the VVB Mineralöle und organische Grundstoffe.

The original idea which involved an expansion of the hydrogenation plant at Leuna at a cost of 125,000,000 DM was abandoned after the planning discussions of the last few months. Instead of the planned construction of a huge distillation facility for crude oil at Leuna, the existing smaller distillation facilities and cracking installations in the other enterprises coming under the VVB Mineralöle und organische Grundstoffe are being adapted to achieve the largest possible refining of crude oil. Through this measure, production of fuel oils is being assigned more and more to the smaller enterprises of the VVB. At the same time, the change in hydrogenation technique for refining mineral oils (i.e., adaptation to medium-pressure processes) is being given up at Leuna. Through these measures, about 90,000,000 DM in investment funds are to be saved. On the other hand, cooperation between individual enterprises is increasing.

After the planned measures for modernization in the plants have been carried out, the estimated figures for individual products will almost be reached without recourse to large-scale changes of techniques in the existing hydrogenation plants. A general survey of the increase of crude-oil refining capacity in the individual plants through the year 1965, after the proposed modernization measures have been carried out, is presented in Table 8 on page 19.

S-E-C-R-E-T

S-E-C-R-E-T

-14-

50X1-HUM

Besides the principal task of increasing production, it is important that a considerable improvement be made in the quality of petroleum products. Beginning in 1960, so-called straight-run gasoline, that is, petroleum distillates in the volatility range of gasoline, will no longer be used as automotive fuel. This means that all the raw gasoline produced at Schwarzheide, Espenhain, Rositz, Gölzau, and Lützkendorf will be subjected to at least one refining hydrogenation in Böhlen or Leuna. As will be seen in Tables 10-15, the Böhlen and Leuna plants are definitely in a position to accomplish this.

Beginning in 1962, part of the raw gasoline will be required in Leuna for olefines, particularly ethylene, obtained by cracking. Low-octane, low-sulphur raw gasolines from Schwarzheide and Zeitz will be procured for the same purposes.

The requirement for raw gasoline for thermal cracking installations will run as follows in the various years:

1962	ca.	67,000	tons
1963	ca.	201,000	tons
1964	ca.	201,000	tons
1965	ca.	268,000	tons

These measures for thermal cracking of low-octane gasolines, combined with putting the L-forming installation in Leuna into operation, will make it possible, from 1960 on, to put considerably better-quality gasolines on the domestic market, in addition to producing gasolines for export. Corresponding to the improved performance of the plants at that time, gasolines with the following octane numbers (CFR Motor Method) will generally be handled:

	VK red Octane number	VK yellow? Octane number
Beginning in 1960	72	80
Beginning in 1963	78	85

If smaller quantities of VK white are produced in the hydrogenation plant at Zeitz in 1960, these goals must be given up.

The production of export gasolines takes place almost exclusively in the VEB Kombinat "Otto Grotewohl" Böhlen, while the production of diesel oils for export is done in Leuna.

The production of jet fuel, as well as of special and test gasolines and of fuel oil, is given in Tables 10-15.

#### 4.1. Modernization Measures of the Individual Enterprises

### 4.1.1 VEB Kombinat "Otto Grotewohl" Böhlen

Foremost among the measures for modernizing the VEB Kombinat "Otto Grotewohl" Böhlen, as far as they affect mineral-oil production is the enlargement of the capacity of the hydrogenation facility, particularly the increase of hydrogen production.

## 1. Politisch-ökonomische Bedeutung der Produktionsgruppe

Comine dem Boochinseen von Partei und Regierung verien der Produktionegruppe Braftstoffe, einschlieselich Heistl und Spezialund Teetbensin zur Lösung der Eksmonischen Hauptanifgebe und in Rabsen der Bealisierung des Chemispragramse in 7-Jahrplan beacht Liebe Antigeben gestellt. Die Bedeutung dieser Productionsgruppe und ihre Stellung im Rahmen der gesenten Volkswirtschaft wird besendere dedurch charakterinist, dass das gesente Verkehrenenen einschl. der in der Landwirtschaft eingesetsten Heterfahrzouge und die Jadustrie mit filmeigen Beargiefragen versongt werden.

#### 1.1 Deterfatzione

In einselnes ergibt sich folgende Aufgabenstellung für die Produktionegruppe Minftsteffes

- a) Beeining dee Belarfe des Eraftveriches (gewerbl. und freier Verhauf en Bunin und Disselbraftstoff
- b) Sinherstelling des Dedarfs der Landwirtschaft an Dermin, Diesellenftstelf und Treibfil.
   c) Versengung der Fischfang-, Rechese- und Binnenflotte mit Die-
- selkraftsteff und Heisfil 4) Deckung des Buftfshrtbedarfs en Bisentreibeteff und Spesial-
- d) Beelung des Entfahrtbedarin de Besentrelbeteit und Spesialvergassehneibsteff
- e) Verserging van Olfeverungsmilegen verschiedener Iniestriebetriebe (Simbl- und Edelstahlwerke, Macchinenbeu und Chemisbetriebe usen) mit Heinfil.

Rises heart the Richerstellung des Bedarfs verschiedener Inductriosveige mit Spenial- und Testbensisen sowie Hösengemitteln (s.B. Ichemsittel-, Rob- und Farbenindestrie sewie Haushaltehenie. Aussestes sind den Expert grüssere Hengen von qualitativ hochwertigen Bensinen und Dieselkraftsteffen sur Verfügung su stellen. Der den Verbenuch der wichtigsten Bedarfsträger 1958 gibt die fol-

In Ionn soll die Verhydrieningskumse in Complibesekumer und eine Bensinierungskumse sur Tweitering der Geformingkumser auf Joo Tiete durchests umpbest werden.

Ab 1962 ist die "rremmag was bensol, ab 1963 was o-tylol and 1964 was "thylbensol asisumehran, da für die Aranten couchi bis sum Anlanien was behredt wie mich bei wollen Ausben eine Ideks besteht, sied felgenie Rauptnelenbran zu ergreifen:

- 2. In Seits int 1962 die Anlage (Suban der Höhlemmer) in Betriet zu nehmen und aus einer Leichtöllfreitlich von Leums und Biblien Leunol für Cumplayathese erseuge Gariterhineus int aus Kohnrichtensenten Leunol zu gewinnen.
- 2. In Ethien int sine 'nlage su errichten, in der o-'ylel sus Referningtennin genomen worden kann.
- In Squeet worden to 1954 die gesonden gewind wen Hengen en Remol, Nyl 1 and Ithylkemol erseugt.

A. Das Bekonstruktionsprogram der Produktionsgruppe Kraftstoffe

Hamptirager der Steigerung der Freduktion an Kraftstoffen ist des neue Erdölfererbeitungswerk Schwedt, welches ab 1965 2 Mis. jate und ab 1965 4 Mis. jate Erdöl vererbeiten wird.

Die Humptlast der Erhöhung der Prokopfpreduktien en treibsteffen bis som Johre 1965 entfällt sonit auf die bestehenden Betriebe der VVB Mineralöle und organische Grundstoffe,

Die ursprüngliche Grundkonssptien, die vorsch, die Hydrierung Lewna mit einem Aufward von 125 mie EM auszubauen, wurde nach den Plandiskussionen der letzten Konate verlassen. Anstelle der geplanten firziehtung einer Großdestillation für Hohol in Lewna, sellen die in den übrigen Betrüben der VVB - Eineralble und eng. Grundeiteffe vorhandenen kleineren Destillationsanlagen und Spaltunlagen auf eine maximale Verarbeitung von Reberdölen ungestellt werden. Destwich verteilt sich als Produktion en Beigsbien und Rohötzesiblen in erhöhten fabe auf die kleineren Betriebe der VVB. Gleiemeitig wird auf die Veränderung der Technologie der hydrierenden Baffination von Minera Stein (Unstellung auf Ritteldrunkprogesse) für Leuns verstehtet, Bure blen (Unstellung auf Ritteldrunkprogesse) für Leuns verstehtet, Bure diese Haßnahmen werden rum 90 Mill. IM Invest-Gelder eingespart.
Andervreite erhöhen sich jedech 41s Koeperationsbesiehungen zwischer den einzelnen Betrieben.

Each der Durchführung der geplasten kekonstruktionmaßnahmen in den Betrieben werden 45 für die einselnen Produkte veranschlagten Kontrollsiffern auch ohne die großtügige Veränderung der Technologie in den bestehenden Hydrierbetrieben in wesentlichen erreicht werden. himen Gesantüberblick über die Steigerung der Erdelvererbeitungsmöglichkeit in den einzelnen Werken in den Jahren bis 1965 mach Durchführung der vorgesehenen Behanstruktionmaßnahmen vermittelt Durchführung der vorgesehenen Behanstruktionmaßnahmen vermittelt den sellem 8. beite 19.

Seben der Hauptaufgabe der Steigerung der Produktion gilt es, die Qualität der brödlpredukte wesentlich zu steigern. Ab 1960 sellen augnannte "Straight-run-Bensine" – das sind Brödlestillate in bensins iedebereiche – Richt nehr als Fahrbensin versendet werden, bensins iedebereiche – Richt nehr als Fahrbensin versendet werden, D. h., skutliche in mehvernheite, Espenhain, Besitz, Gölsen und D. takknaderf anfallenden Behbensine werden in Böhlen eder Leuma Intskenaderf anfallenden Behbensine werden in Böhlen eder Leuma zumindest einer raff. Hydrierung unterworfen, wie in den Tabellen 10-19 der Anlege zu ersehen ist, sind letztere werke hierze durchung der der Land.

Ab 1962 wird ein teil des Bebbennins in leums für die Spaltung auf Olofine- insbesondere auf Athylan - benötigt. Den gleichen Verweneungsweck werden niederektanige Schwefelarne Bebbennine aus vehwersheide und Zeitz nugsführt.

Der Bedarf en Setbennin SW die thermischen Spaltuniegen beläuft sich in den einzelnen Jahren ute folgt:

1962 rd. 67 800 jate
1965 rd. 201 800 jate
1965 rd. 201 800 jate
1965 rd. 201 800 jate
Diese Kafhanne der thermischen Spaltung von wenig klopfesten Benninep in Verbindung mit der Inbetriebnahme der L-Ferning-Anlage in Leuma wird es emöglichen, sebem der Serviellung von Expertbenninen ab 1960 qualitativ wesentlich bessere Bennine ale bisher auf den Harkt su bringen. Antegrechent den derneltigen Verstellungen der Seitsiebe werden in den michsten Jehren in wesentlichen bessine mit mannstehenden Oktanzahlen (C.F.E-Meterschtede) gehandelt werden.
